V-1 Introduction

The HIV-1/SIVcpz protein alignments are based on the complete genome nucleotide alignment, but in some cases a few sequences were removed because they were too short to be informative (especially in Nef), had many stop codons or a strange segment of amino acids. As with the other alignments in this compendium, they are intended to display the genetic variation of the world-wide HIV epidemic in a compact form. They are annotated in more detail than the complete genome nucleotide alignment.

glycosylation NST

Table with columns for glycosylation NNT, CD4 binding, glycosylation NIT, glycosylation NES, gp120 end, and fusion peptide. Rows list various HIV-1 sequences and their corresponding amino acid residues.

fusion peptide

Table with columns: fusion peptide, immunodominant region, glycosylation NAS, glycosylation NKS, glycosylation NHT, glycosylation NYT. Rows list various HIV-1 protein sequences and their corresponding glycosylation sites.
